How to use the Fetch New feature

The Fetch New feature in the Emco Remote Desktop can be very useful when there is a need to find computers added to the network since last enumeration of computers. (Please see the Enumerate Functions in the Remote Desktop for more information).

Before utilizing the Fetch New feature, select either a specific Domain name or the main network tree node, Microsoft Windows Network. If the main network tree is selected, then the program will scan the network and add all computers found that do not currently exist in the machine tree.

If only a domain name is selected then the program will scan only that domain, and fetch computers from that domain and add them to the machine tree.

After selecting the main network tree or a specific domain, access the Fetch New feature from the Machine Tree toolbar. Select the Fetch New Machines or Fetch New Machines via IP-Range options from the Fetch New pop-up:
